

Is a Space Stock Bubble Forming?

Dear reader,

There is no question about it...

Space stocks are in full breakout mode.

Over the last few weeks, investors have piled into anything connected to rockets, satellites, lunar missions, orbital infrastructure, and space communications. And the catalyst is obvious:

SpaceX.

The company's long-awaited IPO filing has done exactly what I expected it would do - bring massive attention to an industry that has spent years developing largely under the radar. Reports suggest SpaceX could be valued at as much as \$1.75 trillion to \$2 trillion, making it one of the largest IPOs in history.

And money is rushing into the sector.

The Stocks Leading the Charge

Just look at some of the recent moves:

- Firefly Aerospace **\$FLY (▼ 3.23%)** continues to break out as investors bet on its growing role in lunar exploration and national security missions.
- Rocket Lab **\$RKLB (▲ 2.71%)** has surged as enthusiasm builds around its launch business and future growth opportunities.

- AST SpaceMobile **\$ASTS (▲ 1.84%)** keeps pushing higher as investors embrace the direct-to-cell satellite story.
- Intuitive Machines **\$LUNR (▼ 1.58%)** remains one of the highest-profile lunar infrastructure plays despite recent volatility tied to NASA contract decisions.

And then there is Redwire **\$RDW (▲ 1.56%)**.

Subscribers to my **Early Opportunities** research service just watched Redwire double in only 13 days.

That kind of move should immediately get investors asking an important question:

Are we witnessing a bubble?

Maybe, but not likely.

What I see is more of a short-term mania. Where stock get ahead of themselves today, but the long-term trend is as strong as ever.

Does that mean investors should be cautious?

Of course.

Whenever capital floods into a fast-growing sector, some stocks inevitably get ahead of themselves. Expectations rise, valuations expand, and short-term pullbacks become more likely.

But that is very different from saying the long-term opportunity is over.

The SpaceX Window Closes Before June 12

The largest stock market flotation in history is now weeks away — and the easy money in small-cap space stocks moves before the opening bell, not after.

Matt McCall has been tracking the small-cap plays tied to this story for months, including **4 small-cap stocks** positioned to surge before the SpaceX IPO.

Get the 4 Stocks Before the Window Closes.

I've Seen This Pattern Before

In the early days of cloud computing, investors questioned whether the growth was sustainable. The same thing happened with smartphones, cybersecurity, electric vehicles, and more recently artificial intelligence.

There were periods when enthusiasm ran hot. There were corrections. There were winners and losers.

But the underlying trends kept moving forward.

That's how I view the space economy today.

The excitement surrounding SpaceX may create short-term volatility. Some stocks may pull back sharply after their recent runs. But the broader story remains intact.

- Commercial space is a secular trend.
- Launch costs continue to fall.
- Satellite demand continues to grow.
- Governments around the world are increasing spending on space and defense infrastructure.
- And NASA's plans for a permanent lunar presence are creating an entirely new economic ecosystem.

Those aren't signs of a bubble. They're signs of an industry entering a new stage of growth.

SpaceX as the Industry's "Coming-Out Party"

Institutional investors who previously ignored the sector are suddenly paying attention. New capital is entering the space economy. Analysts are initiating coverage. Fund managers are scrambling to find publicly traded beneficiaries.

Could some of these stocks pull back sharply? Absolutely. In fact, I would expect periods of extreme volatility.

But I also believe we are still in the early innings of a multi-decade investment opportunity.

That's why I'm watching this rally closely.

Not because I want to chase every stock that's up 30% in a week.

But because I believe SpaceX is doing exactly what I thought it would do: shining a spotlight on one of the most exciting **investment themes of the next decade**.

And when a trillion-dollar company shines a spotlight on an entire industry, investors should pay attention.

Here's to the future,
Matt McCall
